* NOTE: This record contains 93 individual
sequencing reads that have not been assembled into
contigor. Runs of N are used to separate the reads
and the order in which they appear is completely
arbitrary. Low-pass sequence sampling is useful for
identifying clones that may be gene-rich and allows
overlap relationships among clones to be deduced.
However, it should not be assumed that this clone
will be sequenced to completion. In the event that
the record is updated, the accession number will
be preserved.

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Description

Patent No. 6346338
GENERAL INFORMATION:
GENERAL INFORMATION:
APPLICANT: Pavco, Pamela
APPLICANT: Stinchcomb, Dan T.
APPLICANT: Escobedo, Jaime
TITLE OF INVENTION: TREATMENT OF DISEASES OF
TITLE OF INVENTION: TREATMENT OF DISEASES OF
TITLE OF INVENTION: OF VACULAR ENDOTHELIAL
TITLE OF INVENTION: OF VACULAR ENDOTHELIAL
TITLE OF INVENTION: GROWHY FACTOR
NUMBER OF SEQUENCES: 8502
CORRESPONDENCE ADDRESS:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  COUNTRY: U.S.A.

Sequence 137, Application US/09780175
Patent No. 6440738
GENERAL INFORMATION:
APPLICANT: Robert McKay
APPLICANT: Susan M. Freier
APPLICANT: Jacquelline Wyatte
TITLE OF INVENTION: ANTIESSEE MODULATION OF CASEIN KINASE 2-BETA EXPRESSION
FILLE REFERENCE: RTS-0164
CURRENT APPLICATION NUMBER: US/09/780,175
CURRENT FILLING DATE: 2001-02-08
NUMBER OF SEQ ID NOS: 154
EBNGTH: 20
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            APPLICANT: Robert McKay

The present sequence is that of cDNA encoding human FOXC2 winged helix protein (see AAB82851). The cDNA was isolated from a human fat cell cDNA library using a mix of cDNA probes corresponding to DNA-binding domains from different winged helix proteins. FOXC2 (also designated FKHI14) was corresponded to the genes identified. Northern blotting showed FOXC2 to be corresponded to the genes identified. Northern blotting showed FOXC2 to be corresponded for identified. Northern blotting showed FOXC2 to be corresponded for regulating energy balance and adiposity was demonstrated. The invention provides transgenic non-human mammals that are capable of expressing the human FOXC2 gene in their adipose tissue. Methods are corrected for identifying compounds useful for the treatment of medical conditions related to obesity, such as obesity, non-insulin dependent conditions related to obesity, such as obesity, non-insulin dependent stimulate the biological activity of a human FOXC2 polypeptide. Methods are stimulate the biological activity of a human FOXC2 polypeptide. Methods are also provided for identifying compounds useful for the treatment of medical conditions related to malnutrition, such as anorexia (claimed). Such compounds decrease human FOXC2 gene expression or FOXC2 protein conditions related to malnutrition, such as anorexia (claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   240
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  271

The mammalian FOXC2 promoter region for the modulation of FOXC2 polypeptide expression has therapeutic value in treating type II diabetes mellitus, obseity, hypercholesterolaemia, other cardiovascular diseases or dyslipidaemias. This sequence encodes the human transcription factor FOXC2, the promoter of which is described in the invention
                                                                                                                             form of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         expression of a
type II diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CTGCCATTCCAATCCAGCGCGTTTGCTTTTGAATCCATTACACCTGGGCCCCCATAATTA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        82
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention describes an isolated human FOXC2 promoter region. The mammalian FOXC2 promoter region for the madulation of FOXC2 polypeptide expression has therapeutic value in treating type II diabetes mellitus, obesity, hypercholesterolaemia, other cardiovascular diseases or dyslighdaemias. This sequence encodes the mouse mesenchyme forkhead 1 (MHF-1) protein (also called FOXC2 transcription factor), described in the method of the invention

The present invention relates to a method of identifying RNA-binding molecule comprising predicting the structure of RNA-fragment, selecting suitable predicted RNA fragment with an individual stem, synthesising a DNA-fragment corresponding to the RNA fragment, inserting the DNA fragment in upstream proximity of reporter assay gene to form reporter construct and performing a reporter gene assay which detects interaction between a molecule to be tested for RNA-binding and RNA fragment of the reporter construct. The method is useful for identifying an RNA binding is used to illustrate the method of the invention
Identifying RNA-binding molecule by predicting structure of RNA fragment, synthesizing DNA fragment corresponding to predicted RNA structure, performing reporter gene assay after placing the DNA upstream of reporter
                                                                                                                                                                                                                                                                                                                                                                                                                                                     Sequence 125 BP; 7 A; 65 C; 32 G; 0 T; 21 U; 0 Other;

t 0 Identifying at least one gene involved in plant resistance or response pathogenic infection for conferring resistance or tolerance to a plant bacterial, fungal or viral infection by determining or detecting plant expression gene

NO 5263; 899pp; English Claim 27; SEQ ID

```
4
          The present invention relates to a method (M1) for identifying genes involved in plant resistance or response to pathogenic infection. M1 comprises identifying a gene whose expression is significantly attered in the incompatible interaction of plant gene expression relative to expression of the gene in an uninfected plant, in a mutant plant that does not express a gene associated with response to pathogenic infection, or in a corresponding incompatible or compatible interaction. (M1) is useful for conferring resistance to resistance or tolerance to a plant to bacterial, fungal or viral infection. The present sequence was used to
                                                                                                                                                                                                                                                                                                                                          926
                                                                                                                                                                                                                                                                                                                                                                          125

The present invention relates to a method of identifying RNA-binding molecule comprising predicting the structure of KNA-fragment, selecting suitable predicted RNA fragment with an individual stem, synthesising a DNA-fragment corresponding to the RNA fragment, inserting the DNA fragment in upstream proximity of reporter assay gene to form reporter construct and performing a reporter spene assay which detects interaction between a molecule to be tested for RNA-binding and RNA fragment of the reporter construct. The method is useful for identifying an RNA binding molecule. The present sequence is human FOXC2 RNA fragment. This sequence is used to illustrate the method of the invention
                                                                                                                                    961
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Identifying RNA-binding molecule by predicting structure of RNA fragment, synthesizing DNA fragment corresponding to predicted RNA structure, performing reporter gene assay after placing the DNA upstream of reporter

The specification describes antisense oligonucleotides (AAX52869-X55271).

directed against at least 2 mRNAs selected from target genes, coding and concoding regions of RNAs corresponding to target genes, gene initiation codins, genomic flanking regions, intron-exon borders, the 5'-end, the 3'-end and the juxta-section between coding and non-coding regions and all segments of RNAs encoding proteins associated with one or more diseases, conditions or mixtures. The antisense cligonucleotides may be derived from sequences AAX55272-74. These multiple target oligonucleotides from sequences AAX55278-271 and be used for the antisense treatment of diseases and conditions. Typical diseases and conditions are those associated with impaired respiration and inflammation, including lung diseases, pulmonary vascoonstriction, inflammation, including lung distances syndrome, pain, cystic fibrosis, pulmonary hypertension distances syndrome, pain, cystic fibrosis, pulmonary wascoonstriction, emphysema, chronic obstructive pulmonary classes (COPD), and cancers such as leukemias, lymphonas, carcinomas e.g. colon cancer, breast cancer, lung cancer, melasnoma, hepatic metastasized to the lungs, including breast and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ۲,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Sequence 114955 BP; 6071 A; 29417 C; 36712 G; 21328 T; 0 U; 21427 Other;

The invention relates to a novel polynucleotide encoding a guanosine triphosphate-binding protein coupled receptor (GPCR). A polynucleotide of the invention may have a use in gene therapy. The polynucleotide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The polynucleotide sequences shown in ADC85548-ADC87616 encode GPCR's of the

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convext cytosine (C) but not methylated C, to uracil, then part of the genomic contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligomers in the range of publication to both classes, each with at least one member, of oligomers. From the ratio of labels hybridised to the two classes of cligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc. particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously, ABQ13410-ABQ5412 represent genomic DNA sequences used to illustrate the method for disclosure of the invention
                                                                                                                                                                                            Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons
                                                                                                                                                                                                                                                                                             Claim 12; 56pp + Sequence Listing; 56pp; German.
                                                                                                                                                                                                                      diagnosis and prognosis, con
from chemically treated DNA.

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a morif 5-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert of cytosine (C) but not methylated (', to uracil', then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptides-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on clasmes, the degree of methylation is calculated. The method is used of ignmers, the degree of methylation is calculated. The method is used of the amplicon. The diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastroinestinal and respiratory systems etc. particularly by detecting mutations or single nucleotide polymorphisms ('NP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation and the proposal of the central of many C residues to be determined similar the methylation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Determining the degree of cytosine methylation in genomic DNA, useful for diagnosis and prognosis, comprises selective hybridization of amplicons from chemically treated DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             413
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention

The specification describes antisense oligonucleotides (AAX52869-X55271)
directed against at least 2 mRAAs selected from target genes, coding and
non-coding regions of RNAS corresponding to target genes, coding and
codons, genomic flanking regions, intron-exon borders, the 5'-end, the 3'
end and the juxta-section between coding and non-coding regions and all
segments of RNAs encoding proteins associated with one or more diseases,
conditions or mixtures. The antisense oligonucleotides may be derived
from sequences AAX5572-74. These multiple target oligonucleotides
conditions or mixtures. Typical diseases and conditions are those
specifically AAX5180-271) can be used for the antisense treatment of
diseases and conditions. Typical diseases and conditions are those
associated with impaired respiration and inflammation, including lung
diseases, pulmonary vasoconstriction, inflammation, allergic rhinitis,
acute asthma, allergies, asthma, impeded respiration, respiratory
distress syndrome, pain, cystic fibrosis, pulmonary hypertension,
disease (COPD), and cancers such as leukemias, lymphomas, carcinomas e.g.
colon cancer, breast cancer, lung cancer, melanoma, hepatic metastasses, as
well as all types of cancer which may metastasize or have metastasized
to the lungs, including breast and prostate cancer

                                                                                                                                                                                                                                                                                                    836
                                   The invention relates to a novel polynuclectide encoding a guanosine triphosphare-binding protein coupled receptor (GPCR). A polynuclectide of the invention may have a use in gene therapy. The polynuclectide and polypeptide are useful for preparing a composition for treating a patient in need of increased or suppressed activity or expression of the guanosine triphosphate-binding protein coupled receptor. The polynuclectide sequences shown in ADC85548-ADC87616 encode GPCR's of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    libraries constructed from human colon cancer cell lines. The present invention also describes a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell, comprising detecting at least one differentially expressed gene product in comprising sample derived from a cell suspected of being cancerous, where detection of the differentially expressed gene product is correlated with a cancerous state of the cell from which the test sample was derived. The polynucleotides sequences can be used in a method for detecting mammalian cell. The polynucleotides can also be used as probes for detecting and mapping related genes. They can be used in diagnosis and prognosis of diseases and disorders (e.g. identification of pre-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      970 cccentriciocccconcinocccconnidencecconnannicionisconicionicione

```

This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3' present in a genomic sample of DNA. The sample is treated chemically to convert cytosine (C) but not methylated C, to uracil, then part of the genomic DNA that contains the target C is amplified to form a labeled amplicon. The amplicon is hybridised to two classes, each with at least one member, of oligonucleotides and/or peptide-nucleic acid (PNA) oligomers and the degree of hybridisation to both classes is determined from the label on the amplicon. From the ratio of labels hybridised to the two classes of oligomers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therapeutic drugs and or avide and or prognosis of side effects of therapeutic drugs of oligomers, the degree of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastrointestinal and respiratory systems etc., particularly by detecting mutations or single nucleotide polymorphisms (SNP, s), and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation status of many C residues to be determined simultaneously, ABQ13410-524 GCTCAGCGGGGCAGCCGCTCGGACCCCGGCGCGCTGACCCTCGGGGCTGCCGATTCGCTG 583 GOGGCTTGGAGGCCTCCTGCCCCC - - CTCCTCGCGCGGGCCGAGGGTCCACCTTGGTC 640 cciccio de de contra de co GGGTCTTGGAGCCAGCGAGGAGGGGGCCGGCTGCGCTTGCCCGGGGGGCGCCCTCCA 760 761 GGATGCCGATCCGCCCGGTCCGCTGAAAGCGCGCGCCCCTGCTCGGCCCGAGCGACGACGACG 820 ABQ54121 represent genomic DNA sequences used to illustrate the method for determining the degree of cytosine methylation described in the disclosure of the invention 3; Score 68.4; DB 6; Length 712; Pred. This invention describes a novel method for determining the degree of methylation of a particular cytosine in a motif 5'-CpG-3', present in a genomic sample of DNA. The sample is treated chemically to convert genomic sample for methylated C, to uracil, then part of the genomic convert.

The amplicon is hybridised to two classes, each with at least one member, of oligomucleotides and/or peptide-nucleic acid (PNA) oligomers and the amplicon. From the ratio of lasses is determined from the label on the amplicon. From the ratio of lasses is determined from the label on clasmers, the degree of methylation is calculated. The method is used:

(i) for diagnosis and/or prognosis of side effects of therappettic drugs and of a wide range of diseases, e.g. cancer, disorders of the central nervous, cardiovascular, gastroinestinal and respiratory systems etc. particularly by detecting mutations or single nucleotide polymorphisms (SNP's); and (ii) for differentiation of cell or tissue types and for investigating cell differentiation. The method allows the methylation and analyses of status of many C residues to be determined simulated the methylation and analyses.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence 7, Application US/09165264

Patent No. 6197510
GENERAL INFORMATION:
APPLICANT: Ulnayagemoorthy, Thuraiayah

TITLE OF INVENTION: Multi-Loci Genomic Analysis
FILE REFERENCE: 44747

CURRENT APPLICATION UNMER: US/09/165,264

CURRENT APPLICATION UNMER: 1998-10-01

NUMBER OF SEQ ID NOS: 14

SOOTWARE: Patentin Ver. 2.1

SEQ ID NO 7

LENGTH: 320
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       CCTCGCTCCCCCGGCCGC 943
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ORGANISM: Artificial Sequence

                            Sequence 7, Application US/08335865J
Patent No. 6107472
GENERAL INFORMATION:
APPLICANT: Stacker, Steven A.; Hovens, Christopher M.,
APPLICANT: Wilks, Andrew F.
TITLE OF INVENTION: RECEPTOR-TYPE TYROSINE KINASE-LIKE MOLECULES
NUMBER OF SEQUENCES: 21
CORRESPONDENCE ADDRESS:
ADDRESSEE: Fulbright & Jaworski L.L.P.
